## Solutions to the exam of QFT1 of 18 September 2025

$$\mathcal{L} = \sum_{i=1}^{3} \frac{1}{2} (\partial_{\mu} \phi_i \partial^{\mu} \phi_i - M^2 \phi_i^2) + \sum_{a=1}^{2} \bar{\psi}_a (i \partial \!\!\!/ - m) \psi_a + \mathcal{L}_i$$
 (1)

$$\mathcal{L}_i = -g \sum_{i=1}^3 \left( \sum_{a,b=1}^2 \bar{\psi}_a \sigma_{ab}^i \psi_b \right) \phi_i \tag{2}$$

$$= -g \sum_{i=1}^{3} (\bar{\Psi}\sigma^{i}\Psi) \phi_{i}, \tag{3}$$

where the last equality is when writing in terms of the spinor doublet  $\Psi = (\psi_1, \psi_2)$ .

(1) The energy-momentum tensor is

$$T^{\mu\nu} = \sum_{i} \frac{\partial \mathcal{L}}{\partial(\partial_{\mu}\phi_{i})} \partial^{\nu}\phi_{i} + \sum_{a} \frac{\partial \mathcal{L}}{\partial(\partial_{\mu}\psi_{a})} \partial^{\nu}\psi_{a} - \eta^{\mu\nu}\mathcal{L}$$

$$\tag{4}$$

$$= \sum_{i} \partial^{\mu} \phi_{i} \partial^{\nu} \phi_{i} + \sum_{a} \partial^{\mu} \bar{\psi}_{a} i \gamma^{\mu} \partial^{\nu} \psi_{a} - \eta^{\mu\nu} \mathcal{L}.$$
 (5)

The Hamiltonian density is the 00'th component of this, and it is given by

$$\mathcal{H} = T^{00} = \sum_{i} \dot{\phi}_{i}^{2} + \sum_{a} \bar{\psi}_{a} i \gamma^{0} \dot{\psi}_{a} - \sum_{i} \frac{1}{2} \left( \dot{\phi}_{i}^{2} - (\nabla \phi_{i})^{2} - M^{2} \phi_{i}^{2} \right)$$

$$- \sum_{a} \left( \bar{\psi}_{a} i \gamma^{0} \dot{\psi}_{a} + \bar{\psi}_{a} i \vec{\gamma} \cdot \vec{\nabla} \psi_{a} - \bar{\psi}_{a} m \psi_{a} \right) + g \sum_{i} \left( \sum_{a} \bar{\psi}_{a} \sigma_{ab}^{i} \psi_{b} \right) \phi_{i}$$

$$= \sum_{i} \left( \frac{1}{2} \dot{\phi}_{i}^{2} + \frac{1}{2} (\nabla \phi_{i})^{2} + \frac{1}{2} M^{2} \phi_{i}^{2} \right) + \sum_{a} \left( -\bar{\psi}_{a} i \vec{\gamma} \cdot \vec{\nabla} \psi_{a} + \bar{\psi}_{a} m \psi_{a} \right) + g \sum_{i} \left( \sum_{a} \bar{\psi}_{a} \sigma_{ab}^{i} \psi_{b} \right) \phi_{i}.$$

$$(7)$$

(2) In terms of  $\phi^{\pm}$ , we can write the Lagrangian as

$$\mathcal{L} = \frac{1}{2} (\partial_{\mu} \phi_3 \partial^{\mu} \phi_3 - M^2 \phi_3^2) + \partial_{\mu} (\phi^+)^* \partial^{\mu} \phi^+ - M^2 |\phi^+|^2 + \sum_a \bar{\psi}_a (i \partial \!\!\!/ - m) \psi_a + \mathcal{L}_i$$
 (8)

$$= \frac{1}{2} (\partial_{\mu} \phi_{3} \partial^{\mu} \phi_{3} - M^{2} \phi_{3}^{2}) + \partial_{\mu} \phi^{+} \partial^{\mu} \phi^{-} - M^{2} \phi^{+} \phi^{-} + \sum_{a} \bar{\psi}_{a} (i \partial \!\!\!/ - m) \psi_{a} + \mathcal{L}_{i}.$$
 (9)

Introducing  $\sigma_{\pm} = \frac{\sigma_1 \pm i \sigma_2}{2}$ , the interaction Lagrangian in terms of  $\phi_{\pm}$  can be written as

$$\mathcal{L}_{i} = -g \left( \bar{\Psi} \sigma^{3} \Psi \phi_{3} + \sqrt{2} \bar{\Psi} \sigma_{-} \Psi \phi_{-} + \sqrt{2} \bar{\Psi} \sigma_{+} \Psi \phi_{+} \right)$$

$$\tag{10}$$

$$= -g \left( \bar{\Psi} \sigma^3 \Psi \phi_3 + \sqrt{2} \bar{\psi}_2 \psi_1 \phi^- + \sqrt{2} \bar{\psi}_1 \psi_2 \phi^+ \right)$$
 (11)

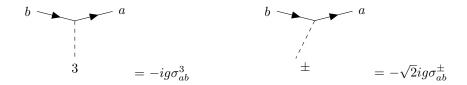

(3) The Feynman rules corresponding to this theory are the following: the propagators are given by

$$a \xrightarrow{p} b = \frac{i(\not p+m)}{p^2 - M^2 + i\epsilon} \delta_{ab}, \ a, b \in 1, 2$$

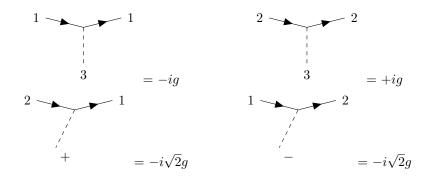

$$3 \xrightarrow{p} 3 = \frac{i}{p^2 - M^2 + i\epsilon}$$

$$\pm \cdots \xrightarrow{p} \cdots \pm \equiv \frac{i}{p^2 - M^2 + i\epsilon}$$

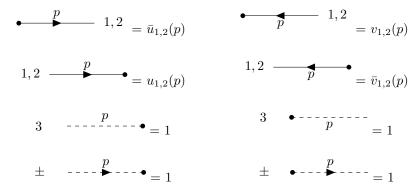

The vertices are

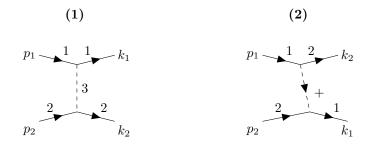

The vertices can be written without the Pauli matrices as

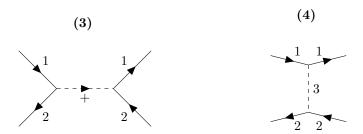

The external lines are just the usual fermionic and scalar lines:

(4) For  $f_1f_2 \to f_1f_2$ , we have the following two processes:

For  $f_1\bar{f}_2 \to f_1\bar{f}_2$  we have the following two processes:

(5) We take the fermion masses to go to zero, but the scalar masses to remain. For the neutral current interaction (diagram (1)), we have:

$$\mathcal{M}_1 = ig^2 \bar{u}_2(k_2) u_2(p_2) \frac{1}{(p_1 - k_1)^2 - M^2} \bar{u}_1(k_1) u_1(p_1). \tag{12}$$

For the charged current diagram (diagram (2)), we have:

$$\mathcal{M}_2 = -2ig^2 \bar{u}_1(k_1)u_2(p_2) \frac{1}{(p_1 - k_2)^2 - M^2} \bar{u}_2(k_2)u_1(p_1). \tag{13}$$

The total, unpolarised, spin-averaged amplitude is given by

$$\frac{1}{4} \sum_{\text{spins}} |\mathcal{M}|^2 = \frac{1}{4} \sum_{s_1, s_2, s_3, s_4} |\mathcal{M}_1|^2 + |\mathcal{M}_2|^2 + \mathcal{M}_1 \mathcal{M}_2^* + \mathcal{M}_1^* \mathcal{M}_2.$$
 (14)

Let's calculate these four contributions separately:

$$\frac{1}{4} \sum_{s_1, s_2, s_3, s_4} |\mathcal{M}_1|^2 = \frac{g^4}{4} \sum_{s_1, s_2, s_3, s_4} \frac{1}{((p_1 - k_1)^2 - M^2)^2} \times \bar{u}_2^{s_4}(k_2) u_2^{s_2}(p_2) \bar{u}_1^{s_3}(k_1) u_1^{s_1}(p_1) u_2^{s_4}(k_2) \bar{u}_2^{s_2}(p_2) u_1^{s_3}(k_1) \bar{u}_1^{s_1}(p_1) \qquad (15)$$

$$= \frac{g^4}{4(t - M^2)^2} \text{Tr}[\not{k}_2 \not{p}_2] \text{Tr}[\not{k}_1 \not{p}_1] \qquad (16)$$

$$= \frac{4g^4}{(t - M^2)^2} (k_2 \cdot p_2) (k_1 \cdot p_1). \qquad (17)$$

A similar calculation yields for the other three terms:

$$\frac{1}{4} \sum_{s_1, s_2, s_3, s_4} |\mathcal{M}_2|^2 = \frac{16g^4}{(u - M^2)^2} (k_2 \cdot p_1)(k_1 \cdot p_2),\tag{18}$$

$$\frac{1}{4} \sum_{s_1, s_2, s_3, s_4} \mathcal{M}_1 \mathcal{M}_2^* = \frac{1}{4} \sum_{s_1, s_2, s_3, s_4} \mathcal{M}_2 \mathcal{M}_1^*$$
(19)

$$= \frac{-2g^4}{(t-M^2)(u-M^2)} \left( (k_2 \cdot p_2)(k_1 \cdot p_1) - (k_2 \cdot k_1)(p_2 \cdot p_1) + (k_2 \cdot p_1)(p_2 \cdot k_1) \right),$$
(20)

where  $t = (p_1 - k_1)^2$  and  $u = (p_1 - k_2)^2$ , and we have made use of the trace identities of the gamma matrices. Putting everything together, we obtain

$$\frac{1}{4} \sum_{\text{spins}} |\mathcal{M}|^2 = g^4 \left[ \frac{4(k_2 \cdot p_2)(k_1 \cdot p_1)}{(t - M^2)^2} + \frac{16(k_2 \cdot p_1)(k_1 \cdot p_2)}{(u - M^2)^2} - \frac{4}{(t - M^2)(u - M^2)} ((k_2 \cdot p_2)(k_1 \cdot p_1) - (k_2 \cdot k_1)(p_2 \cdot p_1) + (k_2 \cdot p_1)(p_2 \cdot k_1)) \right]$$
(21)

(6) For writing everything in terms of Mandelstams, the following relations are useful:

$$s = (p_1 + p_2)^2 = 2p_1 \cdot p_2 = 2k_1 \cdot k_2 \to p_1 \cdot p_2 = k_1 \cdot k_2 = s/2$$
(23)

$$t = (p_1 - k_1)^2 = -2p_1 \cdot k_1 = -2p_2 \cdot k_2 \to p_1 \cdot k_1 = p_2 \cdot k_2 = -t/2 \tag{24}$$

$$u = (p_1 - k_2)^2 = -p_1 \cdot k_2 = -2p_2 \cdot k_1 \to p_1 \cdot k_2 = p_2 \cdot k_1 = -u/2$$
(25)

The amplitude can then easily be rewritten as

$$\frac{1}{4} \sum_{\text{spins}} |\mathcal{M}|^2 = \frac{4g^4}{(t - M^2)^2} \frac{t^2}{4} + \frac{16g^4}{(u - M^2)^2} \frac{u^2}{4} - \frac{4g^2}{(t - M^2)(u - M^2)} \left(\frac{t^2}{4} - \frac{s^2}{4} + \frac{u^2}{4}\right). \tag{26}$$

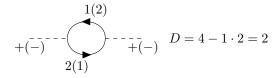

(7) In the limit of large scalar mass, the amplitude reduces to

$$\lim_{M \to \infty} |\mathcal{M}|^2 = \frac{4g^2}{M^4} \frac{t^2}{4} + \frac{16g^2}{M^4} \frac{u^2}{4} - \frac{4g^4}{M^4} \left(\frac{t^2}{4} - \frac{s^2}{4} + \frac{u^2}{4}\right) \tag{27}$$

$$=\frac{g^4}{M^4}(3u^2+s^2)\tag{28}$$

(8) We are asked to draw all 1-loop corrections to the two-point functions (i.e. the propagators) and compute their divergence. This is  $D = 4 - 2P_s - P_f$ .

$$\begin{array}{c}
2(1) \\
1(2) \\
+(-) \\
+(-)
\end{array}$$

$$D = 4 - 2 \cdot 1 - 1 \cdot 1 = 1$$

(9) The Lagrangian has an U(1) symmetry, corresponding to the conservation of fermion number, and a SU(2) symmetry corresponding to a rotation of all the fields.

The U(1) symmetry is under the transformation

$$\Psi' = e^{i\phi}\Psi\tag{29}$$

and the associate Noether current is

$$j^{\mu} = \bar{\psi}_1 \gamma^{\mu} \psi_1 + \bar{\psi}_2 \gamma^{\mu} \psi_2. \tag{30}$$

In order to expose the SU(2) symmetry, consider first a SU(2) transformation of the fermion doublet:

$$\Psi' = \Lambda_{\vec{\theta}} \Psi = e^{\frac{i}{2}\vec{\theta} \cdot \sigma} \Psi. \tag{31}$$

where  $\vec{\theta} = \theta \hat{n}$  is a three vector of length  $\theta$  and  $\hat{n}$  is a unimodular vector.

Upon this transformation, the interaction term, using its form Eq. (3), transforms according to

$$\bar{\Psi}'\vec{\sigma}\Psi'\cdot\vec{\phi} = \bar{\Psi}\Lambda_{\vec{\theta}}^{-1}\vec{\sigma}\Lambda_{\vec{\theta}}\Psi\cdot\vec{\phi}$$
(32)

where we have used a three-vector notation for the Pauli matrices and the scalar fields. Using the properties of the Pauli matrices, it is easy to see that

$$\Lambda_{\vec{\theta}}^{-1} \sigma^i \Lambda_{\vec{\theta}} = R^i_{\vec{\theta}j} \sigma^j, \tag{33}$$

where  $R_{\theta}^{i}$  is a rotation of angle  $\theta$  about the axis  $\hat{n}$ . It immediately follows that the interaction term is invariant if the scalar fields also transform as

$$\phi'^{i} = R^{-1}{}^{i}{}_{i}\phi^{j}. \tag{34}$$

In order to determine the Noether current we write the infintesimal form of the transformations Eq. (33,32)

$$\Psi' = \left(1 + \frac{i}{2}\vec{\theta}\cdot\sigma\right)\Psi + O(\theta^2) \tag{35}$$

$$\phi'_{i} = \left(1 + \vec{\theta} \cdot \vec{M}_{ij}\right) \phi^{j} + O(\theta^{2}), \tag{36}$$

where  $M^{a\,i}{}_{j}$  is the generator of rotations about the a-th axis. We then immediately find that the Noether current is given by

$$J_a^{\mu} = \frac{\partial \mathcal{L}}{\partial(\partial_{\mu}\phi^i)} \delta^a \phi^i + \frac{\partial \mathcal{L}}{\partial(\partial_{\mu}\psi^i)} \delta^a \psi^i$$
 (37)

$$= \bar{\Psi}\sigma^a \gamma^\mu \Psi + i\partial^\mu \phi_i (M^a)^i_j \phi_j. \tag{38}$$
